

FALL PROTECTION

Fall Protection

Is your employee's safety a priority for your company? Construction and manufacturing industries sometimes need workers to perform their duties in uncomfortable conditions or unfriendly environments. The Occupational Safety and Health Administration (OSHA) require protection of these workers. Westbrook can help you ensure that you are fulfilling your legal and moral obligation to provide fall protection for you and your employees.

Westbrook's structural engineering team can help your employee's feel safe in their work environment. Fall protection systems are designed by OSHA Qualified Engineers to maintain OSHA compliance standards for your company. Additionally, to ensure your employees know the proper use of their fall protection system, we will provide technical manuals with drawings.

Fall Protection System

Westbrook developed a fall protection system and user manual for a major bridge contractor. The manual was used to determine the required equipment for a changing work environment that still had to comply with OSHA regulations. Westbrook also designed and tested all structural components of their fall arrest systems such as posts, anchorages and horizontal safety lines.

Our OSHA "Qualified Persons" can help with all of your fall protection needs.
